

## GH stabilizing bracket

### **Use**

The GH stabilizing bracket is installed as a side support for an extended GH ceiling bracket in cases where the rail system has been lowered considerably relative to the ceiling. Even in connection with long suspension lengths this makes the construction very stable.

### **Installation**

One holder is mounted around the suspended aluminium tube on the GH extended ceiling bracket. The other holder is fixed to the wall or ceiling, and the aluminum tube is cut to the right length and installed between the two holders.
